

Cycling & Walking:

GGR424 - Transportation Geography & Planning

Jeff Allen

University of Toronto

January 24, 2022

Today:

- ▶ Benefits of active travel
- ▶ Safety issues and other concerns
- ▶ "Micro" design improvements
- ▶ Designing "complete streets"
- ▶ Networks & connectivity

Active travel - non-motorized mobility

e.g. walking and cycling, but also rollerblading, skateboarding, ice-skating, kick scooters, cross-country skiing, etc.

Can be ...

- ▶ for recreation
- ▶ for travelling to a location

Benefits of Active Travel

Can replace trips by other modes (driving, transit), meaning reduced congestion, pollution, GHG emissions, etc.

The screenshot shows the PubMed.gov interface. At the top is the PubMed logo and a search bar. Below the search bar are buttons for 'Save', 'Email', 'Send to', and 'Display options'. The main content area displays the article title 'Active travel: a climate change mitigation strategy with co-benefits for health' by Chris E Rissel. It includes the journal information 'N S W Public Health Bull. Jan-Feb 2009;20(1-2):10-3. doi: 10.1071/nb08043.', the PMID '19261210', and the DOI '10.1071/nb08043'. The article is marked as a 'Free article'. The abstract text is visible, discussing the benefits of active travel in reducing climate change impacts. On the right side, there are sections for 'FULL TEXT LINKS' (with a PDF icon), 'ACTIONS' (with buttons for 'Cite' and 'Favorites'), 'SHARE' (with social media icons for Twitter, Facebook, and LinkedIn), and 'PAGE NAVIGATION' (with a link to 'Title & authors' and 'Abstract').

Free article

Abstract

Reducing the burning of fossil fuels for transport will help reduce the rate of climate change and the severity of the impact of climate change. The alternatives to private motor vehicles include active travel modes such as walking, cycling and use of public transport. While simultaneously reducing carbon dioxide emissions and traffic congestion, active transport leads to increased levels of physical activity and social interaction. This article summarises a number of NSW active travel initiatives. Despite some positive steps in NSW, other Australian states have invested far more and can demonstrate greater changes in travel behaviour.

Abstract

Go to:

Objectives. We sought to determine the magnitude, direction, and statistical significance of the relationship between active travel and rates of physical activity, obesity, and diabetes.

Methods. We examined aggregate cross-sectional health and travel data for 14 countries, all 50 US states, and 47 of the 50 largest US cities through graphical, correlation, and bivariate regression analysis on the country, state, and city levels.

Results. At all 3 geographic levels, we found statistically significant negative relationships between active travel and self-reported obesity. At the state and city levels, we found statistically significant positive relationships between active travel and physical activity and statistically significant negative relationships between active travel and diabetes.

Economic impacts on local businesses of investments in bicycle and pedestrian infrastructure: a review of the evidence

Jamey M. B. Volker  and Susan Handy 

Institute of Transportation Studies, University of California, Davis, CA, USA

ABSTRACT

Local officials in North America frequently face opposition to new or expanded bicycle or pedestrian facilities. The most vocal opponents are usually motorists and local business owners who fear that the removal of or reductions in vehicular parking or travel lanes will reduce patronage from motorists and that any increased patronage from pedestrians or cyclists will not offset the lost revenues. A lack of direct evidence on the economic impacts of facilities on local businesses has made it difficult to support or debunk such fears. A lack of quantitative evidence in particular has prevented the incorporation of such impacts into cost–benefit analyses. The issue has received enough attention from researchers in recent years that a review of the evidence is now warranted. We reviewed the relevant literature and identified 23 studies, focusing on the US and Canada, that either (1) quantified and compared consumer spending between active travellers and automobile users ($n=8$), or (2) quantified an economic impact to local businesses following the installation of bicycle or pedestrian facilities ($n=15$). Taken together, the studies indicate that creating or improving active travel facilities generally has positive or non-significant economic impacts on retail and food service businesses abutting or within a short distance of the facilities, though bicycle facilities might have negative economic effects on auto-centric businesses. The results
